

Animals should be vaccinated at certain times in their life with certain vaccines to promote correct immune system maturation and prevent disease. To this end we are providing the vaccine schedule and virus definitions on our website... After you have read the vaccine schedule document continue with the virus definition document to learn more about each virus and why vaccination is so important. Please print both documents for future reference.

This document is intended as a reference only, and you should contact your personal veterinarian to seek advice or treatment for your pet.

Canine schedule highly recommended.

6 weeks: Corona/Parvo Combination Vaccine

8 weeks: Distemper/Adeno/Lepto/Parainfluenza + Corona ("DA2LPP+C")
